The current source code release is version **2.45.2**. If you want the newer version, you can build it from [the](#)

Choosing the default editor used by Git

Which editor would you like Git to use?

Use Notepad++ as Git's default editor

Notepad++ is a popular GUI editor that can be used by Git.

This editor is popular in part due to the vast number of available plugins; However, when configured via this option, Git will call Notepad++ with plugins disabled (to open the editor as quickly as possible).

Git 2.45.1 Setup

MySQL Server 8.0.37

Type and Networking

Authentication Method

Accounts and Roles

Windows Service

Server File Permissions

Apply Configuration

Authentication Method

☒ Use Strong Password Encryption for Authentication (RECOMMENDED)

MySQL 8 supports a new authentication based on improved stronger SHA256-based password methods. It is recommended that all new MySQL Server installations use this method going forward.

Attention: This new authentication plugin on the server side requires new versions of connectors and clients which add support for this new 8.0 default authentication (caching_sha2_password authentication).

Currently MySQL 8.0 Connectors and community drivers which use libmysqlclient 8.0 support this new method. If clients and applications cannot be updated to support this new authentication method, the MySQL 8.0 Server can be configured to use the legacy MySQL Authentication Method below.

☐ Use Legacy Authentication Method (Retain MySQL 5.x Compatibility)

Using the old MySQL 5.x legacy authentication method should only be considered in the following cases:

- If applications cannot be updated to use MySQL 8 enabled Connectors and drivers.
- For cases where re-compilation of an existing application is not feasible.
- An updated, language specific connector or driver is not yet available.

Security Guidance: When possible, we highly recommend taking needed steps towards upgrading your applications, libraries, and database servers to the new stronger authentication. This new method will significantly improve your security.

5. Set Up Development Environments and Virtualization (Optional): Consider using virtualization tools like Docker or virtual machines to isolate project dependencies and ensure consistent environments across different machines.

-Installed Visual Studio Code (VSCode): which is a versatile code editor that supports various languages and extensions.

- Set Up Python Development Environment:

-Installed Python.

-Created a virtual environments using tools like venv.

-Used VSCode for Python development.

Version Control with Git:

Installed Git for Windows.

-Set up Git globally with your username and email.

Learnt Git basics (commit, push, pull)..

Docker (Containerization):

Docker allows you to package applications and their dependencies into containers.

Containers share the host OS kernel but remain isolated.

Ideal for microservices architecture and consistent deployment.

Explore Extensions and Plugins: Explore available extensions, plugins, and add-ons for your chosen text editor or IDE to enhance functionality, such as syntax highlighting, linting, code formatting, and version control integration

**GitHub Copilot**

5. **Document Your Setup:** Create a comprehensive document outlining the steps you've taken to set up your developer environment. Include any configurations, customizations, or troubleshooting steps encountered during the process.

Setting Up a Development Environment:

1. **Choose Your Tools and Software:**

List the tools, software, and frameworks you'll be using (e.g., IDEs, text editors, version control systems).

Specify the versions you've installed (e.g., Visual Studio Code, Git, Python).

2. **Installation Steps:**

Provide step-by-step instructions for installing each tool:

Include download links or package manager commands.

Mention any dependencies required.

3. **Configuration and Customization:**

Describe any customizations you've made:

IDE settings (e.g., extensions, themes).

Git configurations (username, email).

Environment variables.

4. **Project Setup:**

Explain how to set up a new project:

Cloning the repository.

Installing project-specific dependencies.

Running tests and build scripts.

5. **Environment Variables:**

Document any environment variables needed for your projects.

Explain where to set them (e.g., .env files, system environment variables).

6. **Troubleshooting Tips:**

List common issues and their solutions:

Git authentication problems.

IDE not recognizing packages.

Network-related errors.

7. Best Practices:

Share coding conventions and best practices:

Code style guidelines.

Commit message conventions.

Folder structure recommendations.

8. Security Considerations:

Highlight security practices:

Avoid hardcoding sensitive information.

Use secure connections (HTTPS, SSH).

9. Version Control Workflow:

Explain your team's Git workflow:

Branching strategies (feature branches, pull requests).

Code reviews.

10. Sample Commands:

Include common commands developers will use:

Git commands (clone, commit, push).

Package manager commands (npm, pip).

```
HP@DESKTOP-IATTMJE MINGW64 ~/github-classroom/Powerlearnproject/se-assignment-1-  
setting-up-your-developer-environment-AllanMachariaM (main) $ python --version Python  
3.12.4
```
